

Large Language Models' Mistakes During Conversation

Bobur Yusupov
Neptun: YTAJDI

September 2025

1 Introduction

Large Language Models (LLMs) such as ChatGPT and DeepSeak are designed to generate human-like text and assist in various tasks. While they are powerful tools, LLMs can produce factual inaccuracies or fabricated content. Documenting these errors is essential to understand their limitations and improve AI reliability.

2 Task Description

The assignment is to find errors in a conversation with ChatGPT or DeepSeak, document them with explanations and images, and submit the file in PDF format. The submission must include the Neptun code and adhere to the deadline of October 31, 11:59 pm.

3 Example of a Mistake: Rumi's Poem *Snow*

I asked ChatGPT about Rumi's poem titled *Snow*. The AI responded that it could not find the original text but a poem inspired by his poem. Actually Jaloliddin Rumi did not write poem titled "Snow", but "Be melting snow". Below is the response of ChatGPT:

4 Evidence

Be melting snow.
Wash yourself of yourself.

Rumi
The Melting Snow: Washing Yourself Clean, Rumi's Way.

Figure 1: ChatGPT's generated response

Figure 2: Rumi's original poem

4.1 Original AI-generated Text (Paraphrased Poem)

ChatGPT also provided this paraphrased version inspired by Rumi's style:

Snow falls softly,
covering the earth in silence.
It does not ask for permission,
nor does it favor one place over another.

Everything it touches
is made beautiful,
even the broken and the weary.

The world holds its breath,
and in that pause,
you might hear your own heart,
pure and untouched,
just like the snow.

Note: This text is *not an actual poem by Rumi* but an AI-generated text inspired by his style.

4.2 Why this is incorrect

- No poem by Rumi exists with the title *Snow*, but he wrote *The Melting Snow: Washing Yourself Clean, Rumi's Way*.
- ChatGPT generated content in Rumi's style, which is a classic example of AI hallucination.
- The AI output may mislead users into thinking this is a real historical text.

5 Analysis

This example demonstrates a common limitation of LLMs: generating plausible-sounding but incorrect information. Such hallucinations occur because the models are trained to predict likely text sequences rather than verify factual accuracy. Users must cross-check AI-generated information with authoritative sources to avoid misinformation.

6 Conclusion

While LLMs are valuable tools for text generation and learning, their outputs should be critically evaluated. Documenting errors, as shown in this example, helps improve AI systems and educates users about potential pitfalls.
